The WOOSTER BRUSH *Company*

History & Table of Contents

The Wooster Brush Company was established in 1851 and is one of the oldest manufacturers of paint applicators in the USA. Our company founder, Adam Foss, traveled from Pennsylvania to Ohio to set up shop. He began producing handmade bristle paintbrushes in a small, two-story building in Wooster, Ohio, and then sold the brushes door-to-door throughout the state.

The Wooster Brush Company acquired land on Madison Avenue in 1909, and a new factory was built. The structure was 70-feet wide and 200-feet long, providing three times as much floor space as before. The Madison Avenue site in Wooster, Ohio is still the location of company headquarters today.

Since Adam’s time, the company has elected only nine presidents; William S. Fagert, Wooster’s current president, was elected on August 1, 2010.

Adam Foss

After more than 165 years in business, Wooster has established many milestones in the industry:

- Invention of popular paintbrush styles such as the angle sash and the Shasta®
- Development of the “Foss-set” process to cement bristle into paintbrushes
- First to use nylon filaments to create brushes that performed in latex paints
- Creation of the Exploded-Tip® process to make soft flags on filament ends
- First to introduce synthetic fabrics for roller covers, now an industry standard

Wooster has continued this tradition of ground-breaking development and today is known as the top applicator innovator. Some of the most popular brands of painting equipment on the market are made by The Wooster Brush Company. Each year, we bring to market new products that make painting easier while providing superior finish results.

Wooster Brush is very proud of our history...a history that was forged with a “made in America mentality” and passed from generation to generation. It still has important meaning for us today, and hopefully it has value to you.

Brush Components

Filament
The working end of the brush, made with synthetic or natural bristle materials.

Ferrule
Metal band that holds the filament and handle together. Attached by nailing or crimping.

Handle
Made of wood, plastic, or other synthetic materials. Provides comfort and good balance.

Spacer
Small wood, plastic, or cardboard strip that creates a reservoir to carry paint.

Epoxy
Type of cement or adhesive that locks filaments or bristles in place.

Handle Styles

 <p>Sash Long, thin handles in regular & rattail styles provide extra control.</p>	 <p>Shortcut[®] Compact handle made of Shergrip[®] elastomeric material for comfort & control in tight spaces.</p>	 <p>Varnish Medium, contoured beavertail handle designed for a comfortable feel.</p>	 <p>Dowel Round, thin pencil-style varnish handle make the brush easy to rotate & direct.</p>	 <p>Shasta[®] Unique, "diamond-cut" handle with thicker shoulder. Shaped to balance a 25/32" brush head.</p>	 <p>Wall Large, thick beavertail style allows a good, firm grip and balances a large brush head.</p>

Roller Covers

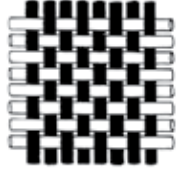

Roller Covers — Making the Right Choice

Approximately 80-90% of the surface of most painting jobs will be coated using a roller cover; choosing a tool that is best-suited for the project is essential for achieving a successful application.

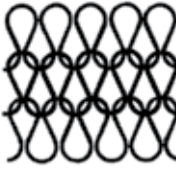

Woven vs. Knit

How a roller fabric is constructed is very important. The more securely fibers are attached to their backing, the less likely a roller is to shed. Think of knitted roller fabrics like shoelaces that have been tied; and woven roller fabrics are like double-knotting those shoelaces.

Woven

Woven fabrics have a backing with a tighter cross section. The pile yarns are made with a twist that helps lock the fibers into the backing, and they are secured using two pass-throughs. This double-lock process results in a shed-resistant fabric that provides a smooth, virtually lint-free finish. Woven rollers may be used with confidence in enamels, primers, and all paints.

Knit

Knitted fabrics have a looped backing, and the pile fibers are secured to the backing with a single pass-through. The resulting fabric is more open than a woven, so it can pickup and release more paint for fast coverage. Knit rollers are typically recommended for flat, eggshell, or satin paints and stains.

Nap Height & Suggested Surfaces

Nap, or pile height, is the length of the fibers that extend from the backing of a roller cover and carry the paint to the surface being coated. Basically, for smooth surfaces use a shorter pile; rough surfaces need a longer pile that is capable of reaching into the valleys of a texture.

ROLLER	NAP SIZE	SURFACE
	3/16" to 1/4"	Untextured plaster, smooth wood, wallboard, new drywall, metal
	3/8" to 1/2"	Most walls & ceilings, lightly textured drywall or wood, paneling, acoustical tile
	3/4" to 1"	Textured plaster or stucco, siding, decks, concrete block
	1 1/4" to 1 1/2"	Heavily textured plaster or stucco, rough wood, brick, or corrugated metal

Miniroller Frames...What's the Difference?

Jumbo-Koter®

Grip

Full-size, polypropylene handle threaded for extension pole use, Sherlock GT® compatible to eliminate twisting.

Shank

Sturdy, chrome-plated 1/4" wire connecting the cage to the grip.

Cage

Precision-engineered to roll smoothly every time, even with heavy materials. Works with both 4 1/2" & 6 1/2" Jumbo-Koter minirollers.

Roller

Made with the same fabrics as full-size Wooster rollers for a seamless finish. Open, 3/4" core makes cleaning easy.

Typical Minis

Grip

Plastic handle, threaded for extension pole use.

Shank

Traditionally, a galvanized 6mm wire designed to support a 6" miniroller. Chamfered end for more universal fit.

Roller

Made with common fabrics. Built-in 7/16" bearing assembly allows the cover to spin.

Jumbo-Koter® Frames

- Solvent-resistant plastic cage, extra-smooth rolling action
- Works with both 4½" & 6½" Jumbo-Koter minirollers
- Full-size, polypropylene grip with reinforced threads, Sherlock GT® compatible

Roller Frames

Sherlock® Frame Components

Cage

Durable, fiberglass-reinforced nylon provides total support to maintain a round cover. The cage has minimal side-to-side movement for better control to paint a clean, straight edge and get very close to corners.

Bearings

Provide super-smooth rolling action and eliminate potential gray streaking by keeping the moving cage off of the chromed shank.

Shank "Sweet Spot"

To remove the roller cover, rap the frame in the 90° bend. This part of the shank is elongated to make it an easier target to hit.

Retaining Ring

Securely locks the roller on the cage, so it won't slip or fall off during painting. When the job is done, it allows the roller to release "hands free" with a soft rap on the edge of a paint bucket or trash can.

GT Insert

Black reinforced collar in many Wooster professional tools that has threads for standard extension poles, plus eliminates twisting when used with Sherlock GT® poles.

Extension Pole Parts

Tip

Holds the roller frame or other tool in place on the end of the pole.

Pole Lock Lever

Easily adjusts pole length every 6 inches with a touch of the thumb and locks securely in place so the pole won't collapse.

Grip

Textured, rubber-like material provides comfort and non-slip leverage.

Outer Pole

Rugged, yet lightweight fiberglass adds strength and helps eliminate flex.

Inner Pole

Made of hexagonal-shaped aluminum to prevent twisting.

Tip Lever

Found on Sherlock GT poles, it allows tools to be attached and released with just one press of the lever.
