

GUS-SI

The Shoulder Immobilizer
 PDAC Approved
 L3670

GUS-SI provides unparalleled patient comfort and support.

- GUS-SI incorporates a deep pocket posterior Gusset panel which provides an intimate and anatomical cradle for the posterior arm, fitting the sling to the arm and NOT the arm to the sling as typical braces do.
- GUS-SI eliminates pressure and irritation with its soft double rolled straps at the neck and waist. They attach and adjust from each end, providing excellent comfort.
- Loop-sliders allow the immobilization straps at both the wrist and elbow to slide close to the body and away from the hand and elbow. This increases support and prevents irritation.
- A comfortable thumb loop rests the thumb, while preventing sling migration.

Posterior Gusset and immobilization slider and strap allow it to seek its best attachment location.

Thumb rest and wrist strap slider

The GUS 500 has all the attributes of the GUS SI but does not come with a swathe strap.
