

INJECTION METHODS

Tracerline® offers four different injection methods, each appropriate for the size of the system being serviced.

TP-9881 REUSABLE SYRINGE

Bottled dyes are extremely cost effective, as they accommodate dye purchased in bulk.

There are two popular bottled dye injectors for A/C systems. A syringe injector is used to manually inject dye into a vehicle's A/C system.

TP-9882 LARGE CAPACITY, FOR RECHARGING

Another popular option when using bottled dyes is a refillable inline injector.

This is recommended for vehicles with larger AC&R systems as it holds up to 2 oz of dye.
